Inline mathematics

Inline formulas take their place in the line: the roots of $ax^2 + bx + c = 0$ are $x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$, the sum $\sum_{i=1}^{n} i$ stays small, and Greek letters such as α, β and γ sit on the baseline.

Subscripts and superscripts like x_i, y^2 and z_j^k change the size of their characters but not the spacing between the lines, so a paragraph with formulas such as $f(x) = e^{-x}$ keeps an even grey.
